

BUDGET
BUDDY

CS-2 PROJECT

BY ALIYAH CELAJES & NAISY DARIA

WWW.BUDGETBUDDY.COM

PROJECT OBJECTIVES

SPECIFIC

To create a Python program that helps users monitor and manage their weekly budget by tracking expenses under specific categories.

RELEVANT

The project promotes financial awareness and responsible spending habits.

MEASURABLE

The program will display total budget balances after every recorded expense.

TIME-BOUND

The program will be fully developed and functional by the end of the 4th Quarter.

ACHIEVABLE

The project will be developed using basic Python programming concepts and completed by the end of the school year.

OVERALL OBJECTIVE

To design and implement a Python-based Budget Tracker that helps users monitor weekly spending, prevent overspending, and build better budgeting habits through categorized expense tracking and automatic budget updates.

FEATURES

 BUDGET INPUT

Allows the user to enter their original weekly budget.

 EXPENSE RECORDING

Allows the user to input daily expenses for specific categories.

 **AUTOMATIC
BUDGET UPDATE**

Deducts the spent amount from the weekly budget and recalculates the remaining balance.

 **WEEKLY
BALANCE CALCULATION**

Updates and displays the user's remaining total weekly budget based on all category expenses.

 DATA DISPLAY

Presents a summary showing each category, its initial budget, total spent, and remaining balance.

 CONTINUOUS TRACKING

Lets the user enter new expenses throughout the week and see updated results.

METHADODOLOGY

File Edit View Help

Key Design Decisions and Trade-offs

The program uses a step-by-step screen flow (start → day selection → input → preview → summary) to make it easier for users to navigate. This improves usability but makes the code longer and more complex.

It also uses global variables like `weekly_data` and `current_day` to share data between screens. This simplifies the program but can make debugging harder.

The app relies on basic Tkinter widgets to keep it lightweight and easy to run without extra tools. However, this limits visual design and modern UI features.

Input validation with `try-except` ensures users enter valid numbers, improving reliability but giving only basic error messages.

Ethical Considerations in Programming Choices

The program respects user privacy by keeping all data local and not storing or sending it anywhere. However, this means data is lost when the app closes.

It is somewhat accessible due to simple labels and buttons, but it lacks features like screen reader support or accessibility settings.

The app also encourages responsible budgeting by tracking expenses and warning users when they exceed their budget.

Finally, input validation helps prevent errors, ensuring users get accurate and safe results.
